

MULTI - AGENT SYSTEMS

THE AGENT CONCEPT IN AI

WHAT IS AN AI AGENT?

An **AI Agent** is an intelligent software component capable of **understanding information, reasoning about it, and taking actions** to achieve specific objectives with help of AI.

Unlike traditional programs that follow fixed instructions, an AI agent can **analyze context, make decisions, and execute tasks autonomously**.

Key Capabilities:

- **Perception:** Receive and interpret input from users or systems
- **Reasoning:** Analyze data, plan actions, and make decisions
- **Action:** Interact with APIs, databases, or other services to complete tasks

AI agents form the foundation of modern **agentic systems**, where multiple agents work together to perform complex processes efficiently.

WHAT IS AN AGENTIC SYSTEM?

An **agentic system** is an architecture composition of **multiple AI agents** collaborating to execute multi-step goals. Each agent performs specialized functions — for example, data retrieval, analysis, or communication with external systems (with help of the MCP servers).
